SUMMARY

Full Stack Developer with 3+ years of experience designing and building scalable web applications using the MERN stack. Strong expertise in React-based user interfaces, Node.js APIs, and MongoDB data modeling. Experienced in cloud deployment, secure authentication, and Agile development within enterprise and financial services environments.

SKILLS

Frontend Development: React.js, JavaScript (ES6+), TypeScript, HTML5, CSS3, Component-Based Architecture
State Management & UI: Context API, Redux Toolkit, Material UI, Bootstrap, Client-Side Form Validation
Backend Development: Node.js, Express.js, RESTful API Development, API Versioning, Middleware Design
Authentication & Security: JWT Authentication, Role-Based Access Control (RBAC), Secure API Design
Databases: MongoDB, Mongoose ODM, Schema Design, Indexing, Aggregation Pipelines
API & Integration: REST APIs, Third-Party API Integration, JSON Data Handling
Cloud: AWS Cloud Architect (2025), Amazon ML Engineer (2025), Google Cloud (2023), Google Cloud ML (2023), Microsoft Azure
DevOps & CI/CD: GitHub Actions (CI/CD), Kubernetes, Bash scripting, Docker Image Management, Build & Release Automation
Testing & Debugging: Postman, Jest, Cypress, JUnit, API Testing, Error Handling, Logging
Version Control & Tools: Git, GitHub, Visual Studio Code, JIRA
Development Methodologies: Agile Scrum, Sprint Planning, Code Reviews, SDLC, MVC Pattern, Scalable Web Applications

PROFESSIONAL EXPERIENCE

State Street Corporation **Boston, MA**
Web Application Developer **May 2024 - Present**

- Developed a React.js web application for portfolio managers and operations teams to review fund holdings, transaction history, daily NAV movements, and performance summaries, reducing manual Excel-based reporting by approximately 35%.
- Managed application state using React Hooks and Context API to support portfolio selection and reporting views, improving data consistency across screens and minimizing redundant backend calls.
- Built Node.js and Express.js REST APIs to serve normalized investment data including positions, cash balances, and valuation snapshots, supporting 10,000+ daily requests with stable sub-second response times.
- Designed MongoDB schemas and aggregation pipelines to compute period-based performance metrics at the database level, eliminating the need for additional processing layers.
- Implemented JWT-based authentication and role-level authorization to control access to sensitive client and fund data, aligning with internal security and audit requirements.
- Supported containerized deployments using Docker on AWS EC2, improving environment consistency and contributing to a ~25% reduction in deployment-related production issues.

Infosys **India**
Full Stack Developer **Jun 2021 - Jul 2023**

- Developed a React.js-based internal ITSM portal used by 2,000+ employees to submit, track, and manage IT service requests and incidents across multiple business units.
- Implemented intuitive interfaces for request creation, approval tracking, and status updates, significantly reducing reliance on email-based communication for operational support.
- Built Node.js and Express.js backend services to manage the full request lifecycle, including submission, approval routing, escalation, and closure, while supporting concurrent user activity.
- Designed MongoDB collections for service tickets, approval workflows, and audit logs, enabling traceability for compliance checks and operational reporting.
- Implemented SLA monitoring and escalation logic within backend services to automatically flag overdue requests, improving average request resolution time by approximately 20%.
- Developed configurable request forms with client-side validation to support multiple service categories, reducing incomplete or incorrect submissions by around 30%.

EDUCATION

Master of Science in Computer Science
Northeastern University, Khoury College of Computer Science, Boston, Massachusetts, USA

Bachelor of Engineering in Computer Engineering
University of Mumbai, Mumbai, Maharasthra, India

PROJECT

Friction Risk Observation Slip Tracking **Oct 2025 - Dec 2025**

- Engineered CMT award winning project using React Native (Expo) and Firebase that combines computer vision scoring, spatiotemporal decay functions, weather multipliers, and population normalization to compute real-time winter road slip probabilities.
